

## FCS Question 2

Our first step is to create a new group called accounting.

```
root@Ubuntu2: /e
root@Ubuntu2:/etc# grep ^accounting /etc/group
root@Ubuntu2:/etc# groupadd accounting
root@Ubuntu2:/etc# grep ^accounting /etc/group
accounting:x:1001:
root@Ubuntu2:/etc#
```

1)a) Now we create a directory called financial\_data in the home directory. We change the ownership of this directory to accounting group. Now we use the setfacl to change the acl for the financial\_data. The -d flag is to specify the default ACL, -R to apply the changes recursively and -m to modify the ACL. The below command gives Read-Write-Execute permissions to accounting group for financial data and its contents.

```
arnav@Ubuntu2:~$ su
Password:
root@Ubuntu2:/home/arnav# cd ..
root@Ubuntu2:/home# ls
A Arn arnav financial_data UserA X
root@Ubuntu2:/home# setfacl -d -R -m g:accounting:rwX financial_data/
root@Ubuntu2:/home# getfacl financial_data/
# file: financial_data/
# owner: root
# group: accounting
user::rwX
group::rwX
other::r-x
default:user::rwX
default:group::r-x
default:group:accounting:rwX
default:mask::rwX
default:other::r--
```

2)a) Now we show that UserA(accounting group) has read-write access to financial\_data using test.txt whose text is changed by this user. We also demonstrate that UserA really belongs to group accounting.

```
$ su - UserA
Password:
$ cd ..
$ cd financial_data
$ ls
sub1 t test.txt X X2
$ cat test.txt
Hi Arnav
$ nano test.txt
$ cat test.txt
Text Changed
$ groups UserA
UserA : UserA accounting
$
```

1)b)The next step is to ensure all other groups and users have only read access to financial\_data using the setfacl command.

```
arnav@Ubuntu2:~$ su
Password:
root@Ubuntu2:/home/arnav# cd ..
root@Ubuntu2:/home# setfacl -d -R -m o::rx financial_data
root@Ubuntu2:/home# getfacl financial_data/
# file: financial_data/
# owner: root
# group: accounting
user::rwx
group::rwx
other::r-x
default:user::rwx
default:group::r-x
default:group:accounting:rwx
default:mask::rwx
default:other::r-x
```

We demonstrate the read access for a User called X who doesn't belong to the accounting group. He can neither create a new file nor cd into any of the subdirectories but he can view contents of the text files which shows his read access to contents of financial\_data.

```
root@Ubuntu2: /home
$ su - X
Password:
$ groups X
X : X
$ cd ..
$ cd financial_data
$ ls
sub1  t  test.txt
$ touch t.txt
touch: cannot touch 't.txt': Permission denied
$ cat test.txt
Text changed
$ cat t
ad
$ cd sub1
-sh: 8: cd: can't cd to sub1
$
```

1)c) & 2)c)Now we demonstrate how any directory inside the financial data folder inherits these ACL settings of the parent directory. We ensured this by specifying the -R flag which applies these ACL settings recursively. We demonstrate by the below screenshot. The ACL for the sub1 subdirectory is the same as the ACL for the parent financial\_data directory.

```
$ getfacl sub1
# file: sub1
# owner: UserA
# group: UserA
user::rwx
group::r-x
group:accounting:rwx
mask::rwx
other::r--
default:user::rwx
default:group::r-x
default:group:accounting:rwx
default:mask::rwx
default:other::r-x
```

3)

We try to give a UserB from tempAccess group access to a subdirectory called tempDir in the financial\_data directory. These are the steps-

1) Use setfacl to set up the read-write-execute access to directory tempDir for group tempAccess. getfacl confirms that the changes were applied.

```
root@Ubuntu2:/home# sudo useradd UserB
root@Ubuntu2:/home# sudo passwd UserB
New password:
BAD PASSWORD: The password is shorter than 8 characters
Retype new password:
passwd: password updated successfully
root@Ubuntu2:/home# sudo groupadd tempAccess
root@Ubuntu2:/home# usermod -aG tempAccess UserB
root@Ubuntu2:/home#
```

```
root@Ubuntu2:/home/financial_data# mkdir tempDir
root@Ubuntu2:/home/financial_data# setfacl -m g:tempAccess:rwx tempDir
root@Ubuntu2:/home/financial_data# ls
sub1 t tempDir test.txt
root@Ubuntu2:/home/financial_data# getfacl tempDir
# file: tempDir
# owner: root
# group: root
user::rwx
group::r-x
group:accounting:rwx
group:tempAccess:rwx
mask::rwx
other::r-x
default:user::rwx
default:group::r-x
default:group:accounting:rwx
default:mask::rwx
default:other::r-x

root@Ubuntu2:/home/financial_data#
```

2) Now demonstrate newly acquired read write access to tempDir directory for userB by creating a new text file test.txt in this subdirectory.

```

$ ls
A Arn arnav financial_data UserA X
$ cd financial_data
$ ls
sub1 t tempDir test.txt
$ cd tempDir
$ ls
$ nano t.txt
Unable to create directory /home/UserB/.local/share/nano/: No such file or direc
tory
It is required for saving/loading search history or cursor positions.

$ ls
t.txt
$ touch test.txt
$ ls
test.txt t.txt
$

```

3) Now revoke access for this group using the -x flag in setfacl. We confirm that the changes were applied using the getfacl command.

```

arnav@Ubuntu2:~$ su
Password:
root@Ubuntu2:/home/arnav# cd ..
root@Ubuntu2:/home# cd financial_data
root@Ubuntu2:/home/financial_data# setfacl -x g:tempAccess tempDir
root@Ubuntu2:/home/financial_data# getfacl tempDir/
# file: tempDir/
# owner: root
# group: root
user::rwx
group::r-x
group:accounting:rwx
mask::rwx
other::r-x
default:user::rwx
default:group::r-x
default:group:accounting:rwx
default:mask::rwx
default:other::r-x

```

4) We demonstrate that the access has been revoked, UserB should only have read-execute access on this tempDir like other non-accounting users. We notice that the UserB can no longer create a new text file using touch command but it has read access to the files like other users.

```
$ whoami
UserB
$ cd testDir
-sh: 6: cd: can't cd to testDir
$ ls
sub1  t  tempDir  test.txt
$ cd tempDir
$ touch a.txt
touch: cannot touch 'a.txt': Permission denied
$
```
